

Jie Zhou

Personal Information

• Phone: 18805268917	Email: jiezhou8917@qq.com
• Major: Computer Science	Position: Go Backend Engineer
• GitHub: https://github.com/zhoujie0420	

Skills

• Solid understanding of data structures and algorithms with strong problem-solving skills
• Proficient in Go, familiar with internals including map, slice, channel, GMP model, GC, and memory escape analysis
• Experienced with Gin web framework; familiar with Argo Workflows for scheduled task orchestration
• Proficient in MySQL, MongoDB, and Redis with SQL tuning experience
• Familiar with RabbitMQ messaging and related development practices
• Hands-on experience with Linux, Docker, Kubernetes, and CI/CD pipelines
• Skilled in AI-native development tools (Claude Code, Cursor); experienced in writing high-quality prompts, maintaining project-level CLAUDE.md, and optimizing context configurations

Work Experience

CardInfoLink	Backend Engineer	2024.01 – 2026.04
Mogujie (Hangzhou Juangua Network)	Backend Engineer (Intern)	2023.08 – 2024.01
AsiaInfo Technologies	Backend Engineer (Intern)	2023.04 – 2023.07

Education

2020.09 – 2024.06	Zhejiang Shuren University	Computer Science	Bachelor's Degree
Achievements: CET-6	Academic Scholarship	RoboCom Robotics Programming	ACM

Project Experience

CardInfoLink — Cross-Border Payment Platform

A cross-border payment service provider covering clearing, acquiring, and platform business modules.

- Participated in on-call for the clearing & settlement module, diagnosing and resolving production issues to ensure system stability
- Designed a card BIN long/short matching algorithm, leveraging goroutines and greedy optimization to reduce task execution time from 10h to 30min
- Optimized reporting tasks with intermediate aggregation, reducing execution time by 70%
- Implemented parallel orchestration of downstream services using errgroup with DAG topological sorting for dependent call chains, reducing API response time from 1.8s to 400ms
- Refactored the file reporter service into a resident process with a scheduling mechanism supporting concurrent execution alongside existing schedulers
- Implemented end-to-end file encryption and maintained internal platform decryption tools to improve on-call analysis efficiency
- Used AI to simulate extreme reconciliation scenarios (one-sided transactions, amount discrepancies, cross-day delays), generating a unit test suite with 99% coverage
- Maintained CLAUDE.md to enforce AI code generation constraints for payment file logic, achieving 99% business compliance in AI-generated code

Mogujie — E-commerce Main Site

Participated in main site development and infrastructure scaffolding maintenance.

- Developed subscription purchase feature by reusing existing forward/reverse order logic, adding sub-order attachment and zero-cost purchase flows to reduce repetitive business operations
- Optimized rate limiting with a leaky bucket algorithm and AOP-based interface-level throttling
- Implemented distributed locks for interface idempotency, reducing upstream business logic complexity
- Improved application scaffolding code standards (exception handling, internal framework usage), reducing new application setup cost by 80%
- Refactored data fetching interfaces using async orchestration for page preloading, improving user experience
- Integrated third-party applications with pluggable architecture reusing main site forward/reverse logic

Godis — Redis Protocol Implementation in Go

A lightweight Redis protocol library implemented in Go.

- Designed and implemented core Redis data structures (strings, hashes, lists) supporting efficient storage and retrieval

- Optimized data operations using Go's concurrency primitives for high-throughput scenarios
- Implemented Redis protocol parsing and command execution with accurate response handling
- Improved caching strategies and memory management for better response times and resource utilization
- Completed persistence functionality including RDB and AOF file strategies
